Product Qualification Report

Discrete Surface Mount Devices

Included Products:

DFN8x8

UF3SC065030D8S

UF3SC065040D8S

This report summarizes the JEDEC qualification results for the 650V UF3SC Discrete SiC Cascodes in DFN8x8 surface mount plastic packages.

The environmental stress tests listed below are performed with pre-stress and post-stress electrical tests. Reviewing the electrical results for new failures and any significant shift in performance satisfies the qualification requirements.

Reliability Evaluation:

The FIT rate data presented below is determined according to JEDEC Standard JESD 85 and is determined from the HTRB and HTGB Burn-In sample size.

FIT = 7.61609 failures per billion device hours

MTTF = 14988.7 years

From the equations:

$$\lambda_{hours} = \frac{X^2(\alpha, \nu)}{2 \times D \times H \times A_f}$$

$$FIT = \lambda_{hours} \times 10^9$$

$$MTTF_{hours} = 1/\lambda_{hours}$$

And

$$A_f = e^{\frac{E_a}{k} \left(\frac{1}{T_{use}} - \frac{1}{T_{test}} \right)}$$

Where:

χ^2 = Chi-Squared probability function for a given Confidence Level (α) and Degree of Freedom ($\nu = 2r+2$, where r = the number of failures in the Test Population),

D = Number of Devices in the Test Population,

H = Test Hours per Device,

A_f = Acceleration Factor from the Arrhenius equation,

E_a = Activation Energy (eV),

T_{use} = standardized Use Temperature,

T_{test} = Temperature of Stress Test,

and

k = Boltzmann's Constant.

In our calculations, we used our HTGB and HTRB Burn-In data:

D = 231 devices for HTGB and 231 for HTRB,

H = 1000 hours for HTGB and 1000 hours of HTRB,

$1 - \alpha = 0.6$ (60% Confidence Level)

r = 0 Failures

$E_a = 0.7$ eV

$T_{use} = 55$ °C or 328 K

$T_{test} = 150$ °C or 448 K
